Proposal Background

- ❑ **Client:** Interac is seeking a comprehensive solution for Asynchronous Verification via a Low Code/No Code Web Portal.
- ❑ **Goal:** Develop a web portal that would allow authorized users to initiate, manage, and track asynchronous identity verification requests by considering **No code/Low code approach**. This portal will leverage the core Interac Verified services (IVS, DVS, VC) and integrate seamlessly with the HUB architecture for request orchestration and result tracking.
- ❑ **Objective:** Provide an easy-to-use tool for internal teams to trigger and monitor identity verification for various use cases (e.g., call center or in-branch verification), without requiring technical knowledge or direct access to backend systems.
- ❑ **Phase Focus:** The initial engagement is focused on developing a web application comprised of three modules: Identity and Access Management, Manually Request Verification, and View Verification Results
- ❑ **Collaboration:** Interac provides high-level requirements and scope of work, expecting proposals that include technical approaches, resource plans, timelines, cost estimates, and potential questions or dependencies for successful delivery.
- ❑ **Technology Stack Overview:** The project will use Use React.js/Next.js (frontend), **Java Spring Boot (backend)**, and AWS-managed PostgreSQL for data retrieval (stateless design).
- ❑ **Proposal Type:** **Fixed-Price** (Project-based)
- ❑ **Assumptions:** BJIT has not included mobile application development for QR code scanning within the current scope of work. It is assumed that the mobile application is either already developed or will be developed separately by Interac at a later stage

Executive Summary

Challenge

Interac is aiming to develop a secure, low-code/no-code web portal to enable authorized internal users to initiate, manage, and track asynchronous identity verification requests using Interac Verified services (IVS, DVS, VC). This solution must integrate with Interac's existing HUB architecture, support multi-tenant access control, and comply with strict data residency (Canada-only) and SOC 2 security requirements — all while minimizing maintenance overhead and development complexity

- ❑ Empowering non-technical users to initiate and track verification requests
- ❑ Managing secure authentication and authorization across multiple organizations and user roles
- ❑ Supporting multi-tenant user access with role-based permissions
- ❑ Ensuring scalability from hundreds to 100K+ verification requests/month
- ❑ Complying with Canada-only data residency and SOC 2 requirements
- ❑ Generating secure, user-specific verification links and QR codes
- ❑ Providing audit logging and real-time status tracking
- ❑ Ensuring zero data storage within the app while integrating with external APIs

What We Can Offer

As a trusted global technology partner with expertise in secure web platforms, identity integration, and open-source solutions, BJIT proposes a modular, scalable, and compliance-aligned portal architecture that directly addresses Interac's requirements

- ❑ End-to-end system design using open-source technologies (React, Java Spring boot, Keycloak)
- ❑ Seamless integration with Interac HUB
- ❑ Multi-tenant user access management, supporting SAML/OIDC federation
- ❑ Secure, audit-logged workflows with no data stored in the app
- ❑ Email + SMS notifications, link generation, QR code flows, retry/schedule options
- ❑ Canada-only hosting on AWS, with adherence to SOC 2
- ❑ Built-in audit logging and a framework for future change tracking
- ❑ Full project lifecycle delivery: design, development, QA, deployment, DevSecOps
- ❑ The production site will be accessible only within Canada and will not be available to users outside the country
- ❑ Flexibility to extend platform with future integrations (CRM, bulk upload, analytics)

Values Realized

BJIT's solution gives Interac a secure, scalable, and compliant foundation for identity verification orchestration — empowering internal users while maintaining strict adherence to data and operational controls

- ❑ **Faster Identity Workflows**
Call center and branch teams gain secure, self-serve tools for identity verification
- ❑ **Low Code, High Control**
Business teams can manage verification without engineering support
- ❑ **No Data Liability**
Interac maintains control of all sensitive data – nothing is stored in the portal
- ❑ **Compliance-Ready Foundation**
System built for SOC 2, Canada-only hosting (Access to the production environment from outside Canada is not permitted), and secure role-based access
- ❑ **Future-Ready Platform**
Easily extendable to include dashboards, analytics, bulk operations, and CRM integrations

No-Code/Low-Code Approach

No-Code for Business Users

- ☐ Easy-to-use web portal with forms to initiate verification (no technical skills needed)
- ☐ Automatic email/SMS and QR code generation
- ☐ Real-time dashboards to view, search, and manage requests
- ☐ No access to backend or APIs required

Low-Code for Admins & Future Needs

- ☐ Admin UI for managing users, roles, and organizations
- ☐ Configurable workflows and future support for bulk uploads, scheduling
- ☐ Integration-ready via webhooks and documented APIs

Scope

Scope of Work (1/2)

- ❑ **Requirement Analysis & Planning:** Analyze the provided high-level requirements and develop a detailed project plan outlining milestones, timelines, resource allocation, cost estimates, and potential dependencies.

The initial engagement is focused on developing a web application comprised of the following three modules:

- ❑ **Identity and Access Management:** The web application must connect to our Employee Identity Provider (IDP) to control and manage access to the service.
- ❑ **Manually Request Verification:** The web application must allow users to manually request verification through the HUB using one of 3 methods: Verifiable Credentials (VC), Document Verification Service (DVS), or Interac Verification Service (IVS). Each request should be tied to the user who initiated it. The application must generate and send an email to the end user, with a clickable link and a scannable QR code, allowing the recipient to access HUB and complete the verification.
- ❑ **View Verifications:** The web application must store all verification results and make them viewable, searchable, and sortable by the initiating user. Users must only be able to view requests they initiated. Users must also have the ability to delete their own verification records. The application should display the status of each verification request.
- ❑ **Application Architecture & System Design:** Design the system architecture for the application considering scalability, performance, secure integration with third-party services, and seamless user experience.
- ❑ **UI/UX Design:** Create intuitive and engaging user interfaces for the web portal following best design practices and adhering to Interac's branding guidelines

Scope of Work (2/2)

- ❑ **Technology Stacks:**
 - ❑ Backend Development: Create robust backend services using **Java Spring boot** and AWS Lambda for real-time processing (If required)
 - ❑ Frontend Development: Develop user interfaces for the responsive web portal using React/Next.js and Tailwind CSS
 - ❑ Authentication Integration: Integrate secure authentication mechanisms using OIDC and SAML protocols (Keycloak)
 - ❑ Database Configuration: Set up an AWS-managed PostgreSQL instance (Amazon RDS for PostgreSQL) for data storage, ensuring privacy and security
 - ❑ Infrastructure Setup: Establish cloud infrastructure on AWS and manage deployments with Kubernetes
 - ❑ Communication Services Integration: Integrate **Sendgrid** for emails and **Twilio** for SMS notifications
 - ❑ Analytics & Visualization: Implement analytics using Chart.js/Recharts for insights from user interactions
 - ❑ Logging & Monitoring: Utilize **Dynatrace/AWS CloudWatch ELK** system health monitoring and troubleshooting
 - ❑ Deployment & CI/CD: Set up pipelines for automated testing, building, and deployment using AWS CodePipeline and GitHub Actions
 - ❑ Caching & Temporary Storage: Use Redis for improved performance and temporary data storage
- ❑ **Manual Functional Testing:** Conduct extensive manual testing to ensure all features function as expected and the application is free from critical bugs or issues
- ❑ **AWS Server Configuration for Dev, QA, and UAT:** Set up and configure AWS servers for different environments (Development, QA, & UAT)
 - ❑ **Interac provides QA & UAT environments**
 - ❑ **BJIT manages the Development environment**
 - ❑ Access of QA & UAT environments - accessible from outside of Canada to support testing and UAT activities
 - ❑ Access of Production environment - strictly restricted to access within Canada only and cannot be accessed from outside the country. **Interac will be responsible for configuring and deploying applications into the production environment**
- ❑ **Release & Support:** Facilitate a smooth release of the application and provide ongoing support to address any post-launch issues or enhancements
- ❑ **Design Documents:** Prepare comprehensive design documents including - API specifications, Architecture document, User manual, & Deployment manual

Out Of Scope

- ☐ Load Testing
- ☐ Stress Testing
- ☐ Vulnerability Assessment and Penetration Testing
- ☐ Test Automation

Scope Details

Features (1/2)

#	Modules	Features
1	Authentication and Authorization	• Authentication Module (SAML, OIDC, multi-IDP support) • Role Management • User Management • Identity and Access Management (Employee IDP integration, permissions management)
2	Organization and User Control	• Organization Management (multi-tenancy, Org setup/removal) • Admin Dashboards and Analytics • Audit Trails and Logging
3	Verification Management	• Manually Request Verification (IVS, DVS, VC methods) • Verification Status Management (Pending, Completed, Failed, Expired, Attempted flags) • Re-trigger Verification Requests • Scheduling Future Verification Requests • Verifications Dashboard (searchable, sortable, deletion capability) • Bulk Upload for Verifications (CSV support)
4	Integration Modules	• Integration & HUB Architecture (Consumer Hub, Data Provider Hub) • Consumer and Data Provider Hubs Integration • Interac Verification Integration (REST API endpoints, OIDC)
5	Communication and Notifications	• SMS Module • Email Module • Email Template Management • Email Logs • Automated Notifications for Status Updates (Email/Webhooks)

Features (2/2)

#	Modules	Features
6	Internationalization and Data Management	• Support for Multiple Languages/Locales (English, French) • Master Data Management • Data Fetching and API Integration (External database, no persistent data storage within the app) • Export functionality (PDF, CSV)
7	Admin Dashboard & Analytics	Dashboard Implementation • Visualize verification trends (charts, graphs, statistics) • User-friendly dashboard for Org Admin and Super Admin Export Functionality • PDF and CSV export features for analytics reports • Scheduled and manual exports
8	Compliance and Security	• Compliance Management (Canada-only, SOC2) • Audit Trails (user actions and administrative activities)
9	Future Enhancements (Phase 2 or later)	• ICRM/Helpdesk/Call Center Integration • Advanced Analytics and Reporting • Change Tracking • Admin Activity Reporting

Solution

Solution Technology

Category		Technology
Frontend		React/Next.js, Tailwind CSS
Backend		Java Spring boot, AWS Lambda (If Required)
Storage	Database	Amazon RDS for PostgreSQL
	Resources(image/document)	AWS S3 Bucket
Monitoring & Logging		Dynatrace, AWS CloudWatch, ELK Stack
Authentication		OIDC, SAML
Analytics & Visualization		Chart.js/Recharts
Communication		Twilio & Sendgrid
Caching		Redis (ElastiCache)
Infrastructure		AWS, Kubernetes (EKS - Elastic Kubernetes Service)
Deployment & CI/CD		AWS CodePipeline, GitHub Actions
Cloud Service		AWS

Cloud Hosting for Web Portal

The diagram depicts a web application architecture hosted AWS, utilizing Nginx as a reverse proxy. ReactJS serves the frontend, while a Spring boot Rest API handles backend logic and communicates with a PostgreSQL database. User requests go through Nginx, which routes them to either the frontend (port 3000) or backend (port 8080). The backend interacts with the database for data storage.

Solution Flow Diagram

- **User logs in** via IAM.
 - **Role determination:** identified as either a **Client User/Admin** or **Super Admin/System User**.
 - **Module access:**
 - Client Admin: manages orgs/users, initiates verification, handles SMS/email/templates, views dashboard.
 - Super Admin: manages clients, master data, roles, users, and admin analytics.
 - **Client Admin initiates manual verification** for a user, choosing one of three methods: IVS, DVS, or VC.
- Routing logic:**
- IVS → sent to IVS service.
 - Else if DVS → sent to DVS service.
 - Else → sent to VC service.
- **Verification outcome** is emailed (via QR/link) to the end-user.
 - **End-user verifies** via the Consumer Hub (e.g. Interac).
 - **Service** sends back a **success/pending/failure result** via webhook.

System Architecture

- **Frontend:**
Built using **TypeScript, Next.js, Tailwind CSS**, accessed by **System Users** via a **Load Balancer**.
- **Backend:**
Implemented in **Java Spring boot**, it handles core logic and integrations.
- **AWS Services Integration:**
 - **Twilio:** SMS notifications.
 - **Sendgrid:** Email delivery.
 - **Dynatrace & Amazon CloudWatch:** Logging and monitoring.
 - **Amazon ElastiCache:** Caching for performance.
 - **PostgreSQL:** Primary data storage.
- **Verification Services** (integrated with backend):
 - **IVS:** Interac Verification Service
 - **DVS:** Document Verification Service
 - **VC:** Verifiable Credentials

Development Estimation

High Level Features and Effort - Web Portal

#	Feature Name	Total efforts (man-months)	Total Amount (In USD)
1	Project Initialization and Setup	0.38	
2	Authentication and Authorization	1.40	
3	Organization and User Control	0.87	
4	Verification Management	2.07	
5	Integration Modules	0.59	
6	Communication and Notifications	1.83	
7	Internationalization and Data Management	2.12	
8	Admin Dashboard & Analytics	1.36	
9	Compliance and Security	0.88	
10	Documentation	0.50	
11	Cloud	1.13	
12	UAT	0.25	
13	Project Management	1.00	
Total		14.38 mm	

High Level Milestone and Effort

Milestone	Details	Total efforts (man-months)	Total Amount (In USD)
1	- Project Initialization and Setup - Authentication and Authorization - Organization and User Control - Verification Management - Integration Modules	6.64	
2	- Communication and Notifications - Internationalization and Data Management - Admin Dashboard & Analytics - Compliance and Security	7.74	
Total		14.38	

AWS Cost Estimation

Cost Estimation - Development Environment

Service Name	Monthly Price (USD)	Overview
Secret Manager	\$4.05	Securely store & manage secrets like API keys, passwords.
ECR (Elastic Container Registry)	\$1.00	Fully managed Docker container registry for storing and deploying images.
EC2 Instance (Elastic Computer Cloud): t3.xlarge, vCPUs: 2, RAM: 8 GB	\$71.63	Virtual server with 2 vCPUs, 8GB RAM, burstable performance.
Virtual Private Cloud (VPC)	\$123.27	Isolated cloud network for AWS resources.
Amazon Aurora PostgreSQL: db.t3.medium (vCPU: 2 Memory: 4 GiB)	\$119.96	Managed relational DB with 2 vCPUs, 4GB RAM, PostgreSQL-compatible.
AWS Lambda	\$1.78	Serverless compute service for running code without provisioning servers.
S3 (Simple Storage Service)	\$17.35	Scalable object storage for files, backups, and data lakes.
Amazon CloudWatch	\$6.93	Monitoring & observability service for AWS resources and apps.
Simple Queue Service (SQS)	\$0.90	Fully managed message queuing for decoupling microservices.
DynamoDB	\$9.24	NoSQL database with seamless scaling, low latency, and high performance.
Total EST.	\$356.11	

Cost Estimation - Staging/Production Environment

Service Name	Monthly Price (USD)	Overview
Secret Manager	\$4.05	Securely store & manage secrets like API keys, passwords.
ECR (Elastic Container Registry)	\$1.00	Fully managed Docker container registry for storing and deploying images.
EC2 Instance (Elastic Computer Cloud): t3.xlarge, vCPUs: 2, RAM: 8 GB	\$143.25	Virtual server with 2 vCPUs, 8GB RAM, burstable performance.
Virtual Private Cloud (VPC)	\$199.39	Isolated cloud network for AWS resources.
Amazon Aurora PostgreSQL: db.t3.medium (vCPU: 2 Memory: 4 GiB)	\$266.92	Managed relational DB with 2 vCPUs, 4GB RAM, PostgreSQL-compatible.
AWS Lambda	\$1.78	Serverless compute service for running code without provisioning servers.
S3 (Simple Storage Service)	\$19.85	Scalable object storage for files, backups, and data lakes.
Amazon CloudWatch	\$6.93	Monitoring & observability service for AWS resources and apps.
Simple Queue Service (SQS)	\$1.80	Fully managed message queuing for decoupling microservices.
DynamoDB	\$22.06	NoSQL database with seamless scaling, low latency, and high performance.
Total EST.	\$667.03	

Project Cost, Team and Execution Plan

Project Cost

#	Cost Items	Cost in USD	Frequency	Comments
1	Design, Development & Testing		One-time	
2	Application Infrastructure (server, hosting, hosting services)		Recurring/Per month	Based on usage
			Recurring/Per month	Based on usage
			Recurring/Per month	Based on usage
3	6-month warranty			BJIT offers a 6-month post-production warranty covering bug fixes for delivered features, excluding enhancements and third-party issues.

Team Setup

High Level Schedule

Note: This is a high-level schedule with milestones, which will be revised during Sprint 1. As we gather more details, the schedule may need further adjustments.

Development Environment, Process and Deliverables

Project Role and Responsibilities

#	Role	Responsibilities
1	Project Manager	• Manage offshore team • Review and feedback on custom development • Prepare and update project progress in PM tools • Review the source code & design documents • Assign tasks to offshore team members and follow up
2	Software Engineer	• Implementing application function development (Java Spring boot, ReactJS, PostgreSQL) • Review function development by software engineer • Support Cloud engineer for application deployment • Support SQA Engineer as needed • Bug fixing
3	SQA Engineer	• Prepare the test cases • Execute test cases • Prepare SQA report & documentation
4	Cloud Engineer	• Configure AWS Development, QA and UAT environment • Prepare Cloud environment for frontend and backend deployment • Cloud cost analysis & architecture diagram • Monitor cloud environment after deployment • Production Deployment
5	UI/UX Designer	• Wireframe designing • UI design with collaboration • Develop UI guidelines & standard

Development Environment & Required Items

Category	Contents	Provider	Remarks
Work location	Offshore: Dhaka	BJIT	
Device	Work device: Laptop	BJIT	
UI/UX	Figma	Interac	<i>Interac will provide the figma account</i>
Development Technology	Java Spring boot, AWS Lambda, React/Next.js, Tailwind CSS	BJIT	
Cloud	AWS	Interac	<i>Interac will provide the AWS account</i>
Management Tool	Source Code Management: Github	Interac	<i>BJIT have own Tool – if client allow to use</i>
	Task Management and Test Management: Redmine/ Jira	BJIT/Interac	
	Document Management: NextCloud/Confluence	BJIT/Interac	

Proposed Agile Development Process

Proposed Review Process

Release Management

- There should have release checklist for all kinds of releases. The checklist should contain -
 - Internal releases are made on time, and testing is conducted as per the defined plan
 - Confirmation or sign-off on the release scope is obtained
 - Release meets coding and testing quality metrics, and sign-off is obtained from the respective personnel
 - Release fulfills all acceptance criteria set by the client
 - All release artifacts are tested and uploaded to the appropriate repositories or locations
 - Release notes, manuals, guidelines, and other necessary documents are approved by the respective personnel
 - Source code is organized and maintained systematically for each release
- A release judgment meeting is conducted, where the checklist is verified step by step, and the decision to release is taken
- Appropriate action plans are developed, and follow-up procedures are established during each release judgment meeting for future reference and improvement

Deliverable Items

#	Item name	Description	Frequency	Date
1	Code & Programs	Updated source code	- At the end of each sprint - At the end of major milestone	As per schedule
2	QA	- Test case - Test report	- At the end of each sprint - At the end of major milestone	As per schedule
3	Documentation	- Deployment manual - User manual	- At the end of each sprint - At the end of major milestone	As per schedule
4	Design Documents	- API specifications - Architecture document	- At the end of each sprint - At the end of major milestone	As per schedule

Communication Method

Daily communication

Category	Contents (Tool)	Language (English)	Owner	Remarks
Mail	BJIT Email/Interac Email	English	BJIT/Interac	
Chat/Meeting	Slack/Zoom/Team	English	BJIT/Interac	
File Sharing	Nextcloud/Sharepoint	English	BJIT/Interac	
Project Management	Redmine/Jira/Confluence	English	BJIT/Interac	

Meeting Calendar

Meeting type	Frequency	Topics	Owner	Attendee	Meeting format
Kick-off meeting	Once: 1 hour	- Team introduction, different processes/meeting/reporting/tool finalization	Interac	(Interac) Management, BSE (BJIT) All team members, sales & ED support team	Remote in Zoom
Scrum	Daily: 30 min	- Yesterday's update, today's plan, any blocker/risk/issue/dependency	Interac	(Interac) BSE (BJIT) All team members, section head (optional)	Remote in Zoom
Sprint planning meeting	Bi-weekly: 1 hour	- Finalizing scope of the sprint	Interac	(Interac) BSE (BJIT) All team members, section head	Remote in Zoom
Status update	Weekly: 1 hour	- Progress status update, burn down status, RAG status, risk/issue/dependency	BJIT	(Interac) BSE (BJIT) All team members, section head	Remote in Zoom
Sprint demo & retro	Bi-weekly: 1 hour	- Sprint delivery demo, what went well, what went wrong, improvement action points	BJIT	(Interac) Management, BSE (BJIT) All team members, section head	Remote in Zoom
Q&A clarification meeting	On demand	- Q&A clarification	BJIT	(Interac) BSE (BJIT) All team members, section head (optional)	Remote in Zoom
Feedback sharing meeting	Monthly: 1 hour	- Team performance status, contract related discussion, scale up/down, future plan	Interac	(Interac) Management, BSE (BJIT) Sales & ED MGT team	Remote in Zoom

Preconditions/Assumptions

#	Preconditions/Assumptions
1	Team Proposal: BJIT proposes a team based on the outlined requirements, with the understanding that this proposal is based on high-level assumptions and may require revisions during project execution
2	UX/UI Designer: BJIT has considered the web portal UX/UI designer
3	Exclusions from Scope: BJIT has not included the following in the scope: • Performance Load, Stress Testing • Penetration Testing • Test Automation
4	Credentials: Interac will provide the required credentials (AWS, GitHub) during the development phase
5	Dev-ops: Based on the initial understanding of the requirements, BJIT has conceptualized a high-level architecture. This may change after receiving more comprehensive requirements from the client side
6	Developer Testing: BJIT will ensure proper developer testing
7	AWS Server Configuration for Dev, QA, and UAT: Set up and configure AWS servers for different environments (development, QA, UAT) ☐ Interac provides QA & UAT environments ☐ BJIT manages the Development environment ☐ Access of QA & UAT environments - accessible from outside of Canada to support testing and UAT activities ☐ Access of Production environment - strictly restricted to access within Canada only and cannot be accessed from outside the country. Interac will be responsible for configuring and deploying applications into the production environment
8	Supported Browsers: The web application must be accessible as long as there is internet access. Accessible through the most common browsers (On Windows: Google Chrome and Microsoft Edge, On macOS: Google Chrome and Safari).
9	Responsive Design: The application will follow a responsive design approach, ensuring optimal display and functionality across various screen sizes without layout issues or breakage
10	Twilio, Sendgrid, Dynatrace: For third-party integrations such as Twilio, SendGrid, and Dynatrace, Interac will provide the necessary credentials and information required for integration

Project References

Xamify - The Smart Way To Take Assessments

Particulars	Details
Name of the Client	Product Division, BJIT
Technology	NodeJs (TypeScript), ReactJs (TypeScript), NextJs (TypeScript), Domain Driven Design, Event-Driven Architecture, MongoDB, Docker, AWS, S3 Storage, Redis, RTK Query, RabbitMQ, Mqtt, GPT-4
Scope of project	• Planning and Market Research • Requirement Analysis and Estimation • Feasibility Study • UI/UX Design • Project Management • Application Development (Web) • Release and deployment • Quality Control (QA Planning, Manual Testing and Reporting)
Project Details	Xamify is an advanced SaaS platform that revolutionizes recruitment and assessment with a user-friendly, multi-tenant design. It offers AI-powered exam creation and evaluation, customizable recruitment workflows, and integrated payment options via Stripe and SSL eCommerce. Companies can manage jobs, roles, and candidates with tailored communication through branded email templates. A vast question bank and AI-generated content support diverse exam formats including coding, audio, and video responses. Built using Agile Scrum methodology, Xamify streamlines hiring processes and enhances decision-making efficiency.

ASD France Intrastat VAT & SO-Post System

Background

- Core business of the client is VAT and DEB (Intrastat) based services since last 20 years
- The client focuses on providing other services (for instance, SoTruck) to expand its service offerings to the customers.
- They had around 8000 customers and envisioned to increase its customers to 50K
- They have many agencies and offices in different countries. They also planned to expand the business in USA

Problem statement

- The client had a centralized software solution - known as Intranet Portal - to automate and facilitate its services.
- The system was developed about 10 years ago using PHP/MySQL technology.
- The system is not flexible to extend for new business requirements, very difficult to learn and operate - causing low productivity, not accessible to all stakeholders - customers and management, not integrated with other systems - sales and accounting
- As a result, the system became a bottleneck for the client to expand their business

Our solution

- BJIT provided a modern cloud-based micro-service, desktop and smartphone-enabled solution that is accessible to all kind of stakeholders, enable business to offer various types of services to the customer, enable business to comply and adapt with rules and regulation in agile manner, having integration ability to other external systems and enable business to validate and verify data processing automatically as much as possible.
- Tech stack: AWS cloud and managed services, micro service-based arch, Angular front with Node backend
- A team of 15 engineers worked for 12 months to complete the development

Benefit to the client

- BJIT provided system helped the client to offer various range of services - for instance, basic and premium- to attract different category of customers.
- The system helped the client to do more processing with less human task which increased the productivity of employees significantly and hence the profit margin of client
- It helped the client to minimize the risk of exposing of its customers wrt tax declaration
- The system helped the client to provide an end-to-end information flow to complete the business activities efficiently by seamless integration with other system

Valmet is the leading Paper, Pulp, Board and Tissue machineries manufacturer

Product Data Management(PDM) is a part of Valmet's large PLM system. Engineers in Valmet maintains their engineering data in this PDM system.

BJIT is testing this product for Valmet for last 18 years. BJIT is also taking care of the development team for last 11 years.

20 dedicated QA engineers

Functional test, UI test, performance test, regression test

Functional test automation

Tools: Redmine, Cimbug, JMeter, Robot Framework, Selenium WebDriver, Sikuli

Award-winning handheld translation device with image and two-way voice translation. Offers convenience and portability for a variety of work environments.

PockeTalk utilizes the best translation engines around the world to provide a consistently accurate experience across 117 languages, including localized dialects.

BJIT is developing and testing this product for PockeTalk for last 6 years.

8 dedicated QA engineers

Functional test, UI test, API test, regression test

Tools: Jira, Google Drive, Postman, Slack

+Style's smart appliances allow you to control various appliances from the entrance to the living room, kitchen, bedroom, etc. with a single app.

BJIT has developed and tested this application.

5 dedicated QA engineers

Functional test, UI test, performance test, regression test, localization

Tuya SDK & API has been used

Tools: Redmine, Confluence, Github

Rakuten Group's 70+ businesses span a broad range of online and offline services, including e-commerce, travel, digital content, fintech, mobile carrier service, and professional sports.

Rakuten is a big ecommerce platform in Japan. We are performing API Test for the Shoppers Gateway of this ecommerce system. The API is developed by ECSG Dev team.

For performing this API testing, we are using Postman. Additionally, we developed a framework to automate test cases for running regression, smoke, sanity test.

BJIT is testing this for Rakuten for last 6 years

10 dedicated QA engineers

API test, Regression test, smoke test

Tools: Jira, Confluence, Postman

Omron Corp (Omron) manufactures and markets automation components, electronic components, social systems, and healthcare equipment.

Omron provides different healthcare devices. They provide different health products to different hospitals based on their requisition.

BJIT is automating their Vital Sight product test cases.

6 dedicated QA engineers

Automating both UI and Non-UI test cases

Automated 1000+ test cases

Tools: Jira, Confluence, Github, Selenium WebDriver, Cucumber, Java, Jenkins, AWS

LTE/Edge Gateway sellers

Amnimo sells LTE/Edge Gateway devices that can store camera data to the cloud. They have different portals to manage this could data.

BJIT is developing and testing this product for Amnimo for last 6 years.

3 dedicated QA engineers

Functional test, UI test, regression test

Automated around 1800 test cases

Tools: Jira, Selenium WebDriver, TestNG

Catia V6 is 3D CAD Design Product

Using this Mechanical Engineering Drawing tool, we are developing integration for Enovia.

We are working in both development of the integration and it's testing and also providing consultancy on PLM

6 dedicated QA engineers

Test Automation for Sanity test for 3DExperience Thick client(Desktop) and Web client

Use Library for OCR based image processing

Automated 300+ test cases

Tools: Robot Framework, Selenium WebDriver, Sikuli

Beauty Saloon management system

A cloud-based enterprise salon system to manage from inventories to staffs, customers, bookings, stylings, catalogues, customer support for all shops of IKINA salon system.

The system consists of several modules – CMS, Web, Android & IOS client

Automated 2000+ test cases for CMS, Web modules.

6 dedicated QA engineers

Tools: Selenium WebDriver, Junit, REST API, Phantom JS, FluentLenium
